

Celeriac

Apium graveolens L.

Prinz

Light-skinned, bunching celeriac with high robustness against bolting. Very suitable for early cultivation under glass, foil or fleece as well as for open field production. Round bulb, comparably smooth, with little tuberous base. Dark green, approx. 40 cm high, very upright leaves in ideal relation to the bulb. Excellent white colour and firm internal quality, suitable for production of large bulbs.

Monarch

Light-skinned standard variety for fresh market and industry cultivation. Heavy, large bulbs with deep-lying, tuberous base. Excellent white colour and firm internal quality. Unsusceptible to iron spots. Stays white during cooking. Very good keeping quality.

Rex

Rex is a light-skinned, particularly vigorous variety and therefore extremely well-suited for producing large bulbs for the fresh market. Also ideal for industrial use. Increased robustness against septoria due to the strong foliage. Smooth bulbs with an excellent internal quality.

Mars

Light-coloured, large, smooth, high round celeriac with dark green, upright foliage. Therefore remarkably high robustness against septoria. Suitable for bunching and as bulbs, for the fresh market and for industry cultivation. Very good keeping quality.

Prestinunpills and Prestinun seed rolls should be stored after receipt – until sowing – in the refrigerator. The storage period usually totals at least **3 weeks**. Please note the printed **best before date**.
